ABSTRACT OF THE DISCLOSURE

A method to remove sulfides and other volatile contaminants from liquor vapor condensate in a pulp manufacturing process, where the mentioned liquor vapor condensate is fed into a stripper, which is part of a closed loop system including the stripper, a regenerative thermal oxidization process (RTO) and a SO₂ scrubber, in which loop a gas is circulated, preferably air, and such components formed or stripped off, in this loop whereafter the circulating gas is stripped off sulfides and other volatile components from the liquor vapor condensate, whereafter the gas stream is fed into a RTO process, where the stripped off contaminants are combusted are under formation of SO₂ and thereafter the SO₂ enriched gas is led to a SO₂ scrubber, where preferably alkali is used as absorption medium, and thereafter the circulating gas is returned back into the stripper.
